Photoshop has many features, and because of the sheer size of its feature set, it can be challenging to learn how to use most of these features. In this book, you discover the basic information that you need to know about working with layers, masks, and blending so that you can get started using the Photoshop editing program. The book examines the layers that you use to edit images and how to manipulate or display them using various editing techniques. You use the Image Ready Format, which enables you to make prints or other Web pages. After you understand the basics of how to work with layers, you then go into details regarding how to create and use masks, how to use various blending modes, and how to work with the many font and text tools that are available in Photoshop. You discover how to work with perspective and change the perspective of layers. You also learn how to create and apply gradients. By the end of this book, you can create and edit a wide range of images and understand the basics of what you need to know to start using Photoshop.

**Breaking Down Photoshop's Layers** When you are creating an image in Photoshop, you're working in an editing environment similar to other Adobe Creative Suite programs that include InDesign, Illustrator, and Photoshop. Here are the layers that you can use for image editing: Background layer: The first layer is the background layer. You put the layer on top of other layers if you need to add a border or other effects to the background before adding any other graphics or text. Masks: You use this layer to apply effects such as masks. You use the Masks tool to apply clipping masks, which you can use to restrict the parts of the image you want to see when you apply a mask effect. If you apply a mask to the foreground layer, you can make the image transparent in the areas that you want to reveal the background. You can use both linear and radial color-filled masks to create smooth or complicated shapes. See Book I, Chapter 3 for more on masks. Thumbnail layer: This layer is like a thumbnail layer. You can use this layer to place image files on the image you are working on without having to open the image in a separate window. For example, you can add a text box to this layer before placing the text in the document window. Using Adjustment Layers Photoshop has a series of adjustment layers that you can use to change the look of an image

We are developing and validating in vitro models to study the mechanisms of the perinatal development of the cerebral microvasculature. The models we are using include the human cerebrovascular endothelial cells (CEC) which form the blood brain barrier (BBB) and the murine brain- microvascular endothelial cells (BMEC) which line the brain microvessels in vivo. These endothelial cells are responding to well-defined cues, including bFGF, to induce and maintain the BBB phenotype. Using these models we will 1) determine the mechanism by which bFGF induces and maintains the BBB phenotype using microarray techniques and 2) determine the mechanism(s) by which BMEC enhance the BBB phenotype induced by bFGF. These studies should provide new information regarding the role of specific endothelial cell phenotypes in the mature CNS and the developing CNS.

287 A.2d 71 (1972) The ASSOCIATION OF SAVINGS BANKERS OF BALTIMORE, INC. v. CHARLIE B. WAGNER, INC. et al. Superior Court of Baltimore City. July 11, 1972. \*72 Frederick H. Intraoperative bispectral index monitoring for detecting transient arousal during craniotomy in patients with brain tumors: a prospective observational study. Transient arousal during craniotomy for brain tumor patients is not uncommon, but few related findings have been reported. Bispectral Index (BIS) is a recently proposed monitor of the depth of anesthesia that may be useful for predicting intraoperative awareness. The aim of this study was to evaluate the effectiveness of intraoperative BIS monitoring for predicting transient arousal during craniotomy in brain tumor patients. We prospectively studied brain tumor patients who were candidate for the operation of craniotomy and the tumor resection. The patients underwent monitoring of the BIS using the I-Aware Neuromonitoring system during the operation of brain tumor resection. Two measures were used to evaluate the patients' level of consciousness during anesthesia. These included the Response to Shivering Scale (RSS), a subjective scale evaluating the consciousness level, and the Regaining of Consciousness Scale (RCS), a more objective scale ( $RSS \geq 3$ ) based on clinical evaluation of the neurosurgical staff. One-hundred and twelve operations in 88 patients were included in the study. There were 68 men and 20 women, and mean age was 36 years. The mean tumor size was 1.84 cm (1-5 cm). During operation, transient arousal was observed in 13 (12.0%) patients. As measured by the RCS, 19 (16.7%) patients met the criteria of transient arousal, and as measured by RSS, 15 (13.4%) patients met the criteria of transient arousal. The incidence of transient arousal measured by RSS and RCS were similar. BIS monitoring during the operation of craniotomy might be helpful to detect transient arousal with a high accuracy. The monitoring of BIS values might be useful for predicting transient arousal during craniotomy in brain tumor patients.
